1.0 EXECUTIVE SUMMARY

1.1 PURPOSE OF THIS REPORT

On behalf of Intermountain Power Service Corporation ("IPSC"), Stantec Consulting Services Inc. ("Stantec") has prepared this report to summarize IPSC's 2022 groundwater monitoring and recovery program pursuant to the United States Environmental Protection Agency's ("US EPA") Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals (CCR) from Electric Utilities, 40 CFR 257 Subpart D (the "Federal CCR Rule")(and the corresponding Utah CCR Rule at Utah Admin. Code R315-319 (the "State CCR Rule")(collectively, the "CCR Rules")) at IPSC's Intermountain Generating Facility ("IGF") located approximately ten miles north of Delta, Millard County, Utah. IPSC's compliance program addresses elements prescribed by CCR Rule Parts §257.90 (R315-319-90) Applicability; §257.91 (R315-319-91) Groundwater Monitoring Systems; §257.93 (R315-319-93) Groundwater Sampling and Analysis Requirements; §257.95 (R315-319-95) Assessment Monitoring Program; and §257.96 (R315-319-96) Assessment of Corrective Measures.

IPSC historical reports presented IPSC's approach for addressing requirements specified by the CCR Rules as well as the facility's Utah Department of Environmental Quality ("UDEQ"), Division of Water Quality ("DWQ") Groundwater Discharge Permit No. UGW270004. The UDEQ Division of Waste Management and Radiation Control ("DWMRC") also has regulatory oversight pursuant to the State CCR Rule, under which DWMRC issued a separate permit on November 23, 2020 for the CCR Units, Permit No. 1601. The CCR Rules apply to each of IPSC's three (3) CCR units (reference Figures 1 and 2 for regional and site-specific, location maps):

- Combustion By-Products Landfill ("CB Landfill"),
- Bottom Ash Basin [surface impoundment underlain by 80-mil High Density Polyethylene (HDPE) liner], and
- Waste Water Basin (surface impoundment underlain by 80-mil HDPE liner).

This annual summary report is formatted in general accordance with reporting requirements prescribed within §257.90(e) (R315-319-90(e)). The report provides an overview of groundwater monitoring and recovery activities conducted at the site during 2022 and ongoing activities designed to further assess and design corrective measures specified by IPSC's Groundwater Discharge Permit and the CCR Rules, as outlined in detail within IPSC's June 2021 *Selection of Remedy Report*.

1.2 BACKGROUND

The DWQ has regulatory oversight for IPSC's compliance with its Groundwater Discharge Permit, which prescribes operation, monitoring, maintenance, and corrective measure protocols for the Bottom Ash Basin and the Waste Water Basin. As detailed in historical reports, the DWQ and IPSC agreed that IPSC would implement a phased groundwater investigation and recovery program that focused initially on removal of Total Dissolved Solids (TDS)-impacted groundwater located downgradient of, and in relatively-close proximity to, apparent historical release areas at the Bottom Ash Basin. IPSC's DWQ permit Groundwater Protection Level for TDS is 1,100 milligrams per liter (mg/L; i.e. parts per million-ppm). Groundwater recovery wells WR-101, WR-102, and WR-103 have been used since 2010 for recovery of TDS-impacted groundwater as part of IPSC's Groundwater Discharge Permit compliance program (reference Figure 3 for well locations).

The DWQ and IPSC agreed that additional groundwater monitoring wells, including sampling and pump-testing of wells associated with CCR Rule compliance, would be installed to help delineate more precisely the location and hydraulic characteristics of the downgradient leading edge of the TDS plume located southwest of the Bottom Ash Basin. Following delineation of the downgradient leading edge of the TDS plume, then IPSC would evaluate how best to control the downgradient migration of the plume, remediate the plume to permit standards, and ensure ongoing protection to human health and the environment.

Once IPSC's groundwater quality monitoring program expanded under its CCR permit, IPSC identified that TDS had also impacted groundwater quality downgradient of the Waste Water Basin. As has been consistent since monitoring of water quality began at the IGF, TDS has been found to have migrated farther downgradient of the Bottom Ash Basin and Wastewater Basin than any other Groundwater Discharge Permit or CCR water quality analyte, including boron and CCR Appendix IV metals. Appendix IV metals have either not impacted groundwater quality, or as detailed herein, elevated metal concentrations have only been identified in samples from wells in close proximity to the apparent historical release areas.

As such, TDS is being used as the leading indicator parameter of impacted groundwater quality for fashioning a more expansive groundwater remediation program. No supplemental wells were deemed necessary downgradient of the Combustion By-Products Landfill, as all CCR constituent concentrations quantified to date represent typical background concentrations.

During 2020, as part of its corrective measure assessment, IPSC installed 25 wells to more definitively delineate the leading edges of TDS plumes located downgradient (southwest) of the Bottom Ash Basin and the Waste Water Basin. Several of the wells were pump-tested to investigate localized hydraulic characteristics. To date, IPSC has installed 84 groundwater monitoring wells as part of DWQ and DWMRC regulatory compliance and investigation of the downgradient leading edges of the TDS plumes.

Stantec utilized the 2020 pump-test results and October 2020 groundwater quality data to update its site-specific groundwater fate and transport model. The model was used to help identify which wells might be used for groundwater recovery to help reduce total mass of CCR constituents in groundwater and control the downgradient migration of such constituents.

Final selection and design of the expanded groundwater remedy was documented in IPSC/Stantec's June 2021 *Selection of Remedy Report*. IPSC and Stantec finalized design for planned expansion of IPSC's existing groundwater recovery network by increasing the number of wells being used for groundwater recovery to help reduce total mass of CCR constituents in groundwater in pursuit of achieving Groundwater Protection Standards, control the downgradient migration of such constituents, and provide ongoing protection to human health and the environment.

Currently, IPSC is installing groundwater recovery pumps, recovered water conveyance piping, additional electricity capacity, and related equipment associated with the expanded groundwater recovery network. As additional groundwater quality data is generated and evaluated through statistical analysis, IPSC is prepared to further expand and/or enhance the groundwater monitoring and/or remedial approach, if warranted. Currently, and for the foreseeable future, the CCR constituent plumes downgradient of the two surface impoundments do not pose any unmitigated risk to human health, ecologic receptors, and/or the environment.

2.0 SPRING AND FALL 2022 MONITORING ACTIVITIES

2.1 MONITORING, PURGING, AND SAMPLING PROTOCOL

During each of the two sampling events conducted respectively during April/May and October/November 2022, all CCR compliance wells were purged and sampled, following measurement of static water levels. All water level monitoring and well purging and sampling activities were performed in accordance with measures outlined within IPSC's November 2015 *Ground Water Sampling and Analysis Plan*, a copy of which is posted on IPSC's public website. Groundwater samples were submitted to Chemtech-Ford Laboratories (CTF), a Utah-certified, analytical laboratory under strict Chain-of-Custody protocol.

Figures 3A and 3B present potentiometric maps based on water level measurements collected at CCR monitoring wells during April and September 2022. Groundwater potentiometric and apparent flow direction characteristics remain similar to those observed historically. The predominant groundwater flow direction in relatively close proximity to the Bottom Ash Basin and the Waste Water Basin is generally toward the southwest, with a more westerly component of flow due west of the northwestern corner of the Waste Water Basin. Groundwater flow in the vicinity of the CB Landfill is generally from the east toward the west.

Table 1 presents groundwater monitoring well construction details, including well completion dates, diameters, depths, screened intervals, and top of casing elevations (mean sea level-msl). Attachment 1 presents monitoring well drilling logs and schematic diagrams. Attachment 2 includes summaries of historical water level measurements including the Spring and Fall 2022 data.

2.2 ANALYTICAL RESULTS

2.2.1 TDS Results

Figures 4A and 4B herein identify TDS concentrations quantified during the Spring and Fall 2022 sampling events, superimposed atop the respective Spring and Fall 2021 groundwater flow potentiometric maps. As observed in the past, groundwater quality monitoring data at the boundaries and down-gradient of the CB Landfill are deemed representative of Background water quality conditions. The quantitative analytical results associated with monitoring of the two surface impoundments are relatively similar to those observed during past monitoring events.

TDS concentrations in excess of background concentrations and the DWQ Groundwater Discharge Permit Groundwater Protection Level for TDS of 1,100 ppm were detected in monitoring well WDB-5 (1,880 ppm) and well WWC-7 (1,220 ppm) for the first time since sampling began in 2015. Future ongoing monitoring of water quality at each well will be used to gauge whether these TDS results are representative of site-specific conditions or not. IPSC is prepared to install area-specific, supplemental groundwater monitoring and/or recovery wells, if needed.

2.2.2 CCR Appendix IV Results – Exploratory Data Analysis

The initial step of statistical analysis was the exploratory data analysis of CCR Appendix IV analytical results generated at the site to date. The process of the exploratory data analysis utilizes simple summary statistics (e.g., mean, median, standard deviation, and percentiles) and graphical representations to identify important characteristics of an analytical dataset, such as the center of the data (i.e., mean, median), variation, distribution, patterns, presence of outliers, and randomness.

Summary statistics were calculated for each well-constituent pair at each CCR-regulated unit (Tables 2A through 2C). These summary statistics include information such as total number of available samples, frequency of detection, and maximum detected concentrations for each well-constituent pair. Exploratory data plots for each well-constituent pair (i.e., box plots and time series plots, Attachments 3 and 4, respectively) were also constructed to support a visual review of the data and identify potential outliers.

2.2.3 CCR Appendix IV Results – Comparison of Groundwater Quality Data to Groundwater Protection Standards

Statistical methods consistent with US EPA document "Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities: Unified Guidance" (US EPA 2009; hereafter referred to as the Unified Guidance) were utilized to compare Appendix IV parameter concentrations in groundwater to their respective fixed standards known as the Groundwater Protection Standards (GWPS). GWPSs were established as the greater value between the US EPA Maximum Contaminant Level (MCL) or US EPA alternative standards (Cobalt, Lead, Lithium, and Molybdenum) or the Upper Tolerance Limit (UTL) calculated using historical background data collected from wells upgradient of the CCR units. Summary CCR unit-specific data are presented in Table 2D.

In the Unified Guidance, a confidence interval approach is recommended for comparing groundwater quality data to a GWPS. If the underlying population is stable (i.e., no trend is present), then the Unified Guidance indicates that comparison to the GWPS can be made based on a confidence interval around the mean. However, in the presence of a statistically significant trend, the Unified Guidance recommends constructing a confidence band around a trend line, where the comparison is made to the GWPS based on the confidence band as of the most recent sampling event, rather than a static confidence interval around the mean.

Initially, data from each constituent/well pair were screened to identify if there were detected concentrations greater than or equal to their respective GWPSs. If no detected concentrations exceeded the respective GWPS, the constituent/well pair was not evaluated further. If a detected concentration exceeded the GWPS for any constituent/well pair, then linear regression analysis was completed to identify constituent/well pairs with a statistically significant linear trend ($p<0.05$). As noted above, if no statistically significant linear trend was detected ($p\geq0.05$), a static confidence interval around the mean was used for comparison to the GWPS. If

a statistically significant linear trend was present ($p<0.05$), a confidence band around the linear regression trend line at the most recent evaluated sampling event was used for comparison to the GWPS. In both cases, 98% confidence intervals were constructed, which correspond to a lower confidence limit with 99% confidence. Non-detect values were conservatively represented at the reported detection limit. Trend lines with confidence bands are included in Attachment 5.

Table 3 is a graphical ("Stop-Light") presentation of the statistical findings that includes color-coded cells, as detailed herein. "Green" cells represent constituent/well pairs where no detected concentration exceeded their respective GWPS. "Yellow" cells represent constituent/well pairs where at least one detected concentration exceeded the respective GWPS, but the lower confidence limit/confidence band was below the GWPS (not a statistically significant level [SSL] above the GWPS). "Red" cells represent constituent/well pairs where at least one detected concentration exceeded the respective GWPS, and a lower confidence interval/confidence band exceeding the GWPS. "Red" cells represent SSLs above the GWPS.

Stantec's evaluation of 2022 quantitative analytical results associated with monitoring under the CCR Rule indicate the below-tabulated Appendix IV constituent/well pairs represent SSLs above their respective GWPSs. There have been no SSL exceedances associated with the CB Landfill to date.

CCR Appendix IV SSLs in excess of GWPSs			
CCR Unit	**Constituent/Well Pair**	**Lower Confidence Limit/Lower Confidence Band (LCL/LCB)**	**GWPS**
CB Landfill	No SSLs above GWPS		
Bottom Ash Basin	Molybdenum/BAC-2	0.156 mg/L	0.1 mg/L
Waste Water Basin	Arsenic/WWC-1	0.0219 mg/L	0.01514 mg/L
	Arsenic/WWC-3	0.0218 mg/L	0.01514 mg/L

It should be noted that historical statistical analyses before 2022 indicated that Arsenic and Lithium exhibited localized SSL exceedances above their respective GWPSs within monitoring wells located immediately adjacent to the two basins' unit boundaries, as follows: Lithium at wells WWC-1 and BAC-3 and Arsenic at wells BAC-2 and WWC-1 through WWC-5. However, when evaluating all historical data including the two sets of water quality results generated during 2022, only the three above-listed wells were identified as exhibiting GWPS exceedances, as of autumn 2022. As the cumulative volume of water quality data increases with additional future sampling events, it is anticipated that statistical analysis results should become increasingly more accurate.

Although it is well documented[1] that naturally-occurring Arsenic and Lithium can be present in soil and groundwater at elevated concentrations in basin-fill sediments and aquifers throughout the Basin and Range Physiographic Province of the western United States (including Lake Bonneville sediments similar to those underlying the IGF), attributable to volcanic rock source material and lacustrine and hot spring deposits, IPSC will continue monitoring these and other CCR Rule metal constituents in groundwater as part of its routine groundwater monitoring program. For reference, the IGF is located within a few miles of large volcanic topographic features, including Baker Hot Springs and the adjacent 9-mile by 6-mile Fumarole Butte/Crater Bench. Moreover, Stantec is aware of local Lithium mining operations located throughout Juab County, Utah and elsewhere within the footprint of historical Lake Bonneville basins similar to those within which the IGF is located.

However, as noted above, water quality data generated at the IGF to date (2015 through 2022) indicate that only two CCR Appendix IV metals (Arsenic and Molybdenum) exceed corollary GWPSs in wells located at the basin boundaries of the two surface impoundments. If the metal concentrations were attributable to localized release of CCR constituents from the CCR impoundments (i.e., anthropogenic presence), it is anticipated that the rate of vertical migration of released CCR metal constituents beneath the basins into the unsaturated, vadose zone above the water table has been historically, and will continue to be, retarded (decelerated) as a direct result of physical retardation atop and within the low-permeability clays as well as natural adsorption and cationic exchange within the porous, clay-rich soils. Likewise, given the relatively thick and impermeable clay-rich soils located below the water table (saturated, phreatic zone) characterizing the IGF subsurface, it is anticipated that similar retardation of metals is likely, historically and in the future. The clay-rich nature of soils and aquifers underlying the IGF and surface impoundments are discussed in detail in numerous preceding IPSC reports.

Typically, TDS tends to migrate at the same rate as the average linear groundwater flow velocity; however, Appendix IV metal constituents, such as Arsenic, Molybdenum, and Lithium, are not anticipated to migrate at the same velocity as natural groundwater given the clay-rich nature of the uppermost aquifer beneath the site. Natural attenuation processes, such as adsorption, cationic exchange, dispersion, and biological degradation, tend to slow the lateral (saturated, phreatic zone) movement of metals in clay-rich aquifers. Accordingly, IPSC intends to continue to utilize TDS as a leading indicator parameter of impacted groundwater quality at the site.

As additional groundwater quality data is generated, CCR constituent concentrations will be evaluated through statistical analysis, in accordance with CCR Rule. Ongoing/future water quality data will be evaluated to determine whether additional monitoring and/or recovery

wells might be warranted for appropriate CCR constituent-impacted groundwater control and remediation.

3.0 ONGOING CORRECTIVE ACTIONS AND PROGRESS TOWARD INITIATING EXPANDED GROUNDWATER CORRECTIVE ACTION REMEDY

3.1 ONGOING GROUNDWATER RECOVERY AT EXISTING RECOVERY WELLS WR-101, WR-102, AND WR-103

IPSC intends to continue operation of existing groundwater recovery wells WR-101, WR-102, and WR-103. The three wells are recovering TDS-impacted groundwater from the generalized middle of the estimated TDS plume that is migrating southwest of the Bottom Ash Basin. Continued removal of TDS-impacted groundwater from each of these three wells is helping reduce the total mass of CCR constituents in the uppermost aquifer beneath areas of the site located downgradient of, and in close proximity to, the Bottom Ash Basin.

3.2 INSTALLATION OF SELECTED, EXPANDED GROUNDWATER REMEDY

Final selection and design of the expanded groundwater corrective action remedy was documented in IPSC/Stantec's June 2021 *Selection of Remedy Report*. The report provided detailed analysis of the extent and nature of impacted groundwater associated with the surface impoundments, a summary of corrective measures assessment, and evaluation of the selected remedy in terms of short- and long-term effectiveness and appropriate protection to human health and the environment.

Groundwater quality data to date, including the 2022 results, indicate that TDS has migrated farther down-gradient of the two surface impoundments than other CCR constituents, including Appendix IV metals. As discussed in detail in IPSC's November 2020 *Demonstration of Requirements for Alternative Closure Deadline under 40 C.F.R. §257.103(f)(2) Report* and IPSC's November 2020 *Amended Assessment of Corrective Measures* report, IPSC and Stantec anticipate that recovery of TDS-impacted groundwater at select recovery wells will also intercept metal constituents that might be present, as TDS is expected to continue to migrate at a faster rate than dissolved metals in the clay-rich aquifer that underlies the property.

Currently, and until a new evaporation basin is constructed in 2023, all recovered groundwater is being discharged into the Ash Recycle Basin for evaporation. Presently, IPSC is designing a new evaporation basin system that will be installed before the June 2025 transition from the existing coal units to the new natural gas- and hydrogen-fired units. Once constructed (anticipated to be 2023), IPSC intends to use the proposed evaporation basin system rather than the Ash Recycle Basin for future evaporation of recovered groundwater as part of its CCR and Groundwater Discharge Permit compliance programs.

At this time, IPSC intends to use the following wells for groundwater recovery and plume control:

- Bottom Ash Basin Plume Control:
  wells WR-101, WR-102, WR-103, RW-9, BAC-11, BAC-13, BAC-14, and BAC-18 through BAC-38.

- Waste Water Basin Plume Control:
  wells: WWC-1, WWC-4, WWC-5, RW-4, WWC-6, and WWC-7 through WWC-17 (excluding WWC-11).

In summary, groundwater will be recovered by means of dedicated, submersible pumps in recovery wells, as being implemented currently at existing recovery wells WR-101, WR-102, and WR-103. Each wellhead will be interconnected with a buried trunkline that will discharge recovered groundwater to the 80-mil, HDPE-lined Ash Recycle Basin located immediately south of the Bottom Ash Basin. The recovery network will be integrated with the existing recovery system and include all necessary equipment and appurtenances to transfer recovered groundwater from the wells to the Ash Recycle Basin and permit future monitoring and sampling of all the recovery wells.

As detailed in IPSC's *Selection of Remedy Report*, Stantec provided engineering and design services to IPSC for enhanced TDS plume control and associated groundwater recovery. Design elements included, for instance:

• Final basis of design;

• Process flow diagram supported by a hydraulic pumping and conveyance model;

• Piping and instrumentation (P&ID) drawings;

• Typical recovery well completion detail.

• Finalized hydraulic model of the pumping and conveyance system;

• Typical design details for the recovery wells and surface completions;

• Underground yard piping;

• Control philosophy for the system;

• Electrical single-line and termination drawings; and

• Equipment and construction specifications.

Currently, IPSC is installing equipment associated with the proposed expansion of the existing groundwater recovery well network that will include additional groundwater recovery wells and recovered water conveyance piping. IPSC is also providing additional localized, electrical power supply to service the new submersible pumps and water conveyance and monitoring appurtenances. Currently, and continuing into the 2023 construction season, IPSC is installing the expanded groundwater recovery system equipment and materials.

As detailed in IPSC's November 2020 *Demonstration of Requirements for Alternative Closure Deadline under 40 C.F.R. §257.103(f)(2) Report*, the CCR constituent plumes pose no unmitigated risk to on- and off-site human health. Given the vast real property acreage (4,614-acres) that is owned by the owner of the IGF, Intermountain Power Agency (IPA), as well as the relatively significant distances to off-site potential receptors who might use groundwater for potable and/or non-potable uses (approximately 2.5-miles away), IPSC anticipates that it can implement supplemental plume control measures so as to mitigate any such future potential exposures in a prompt and timely manner.

2022 ANNUAL GROUNDWATER MONITORING AND CORRECTIVE ACTION SUMMARY REPORT

January 18, 2023

Figures 4A and 4B. Spring and Fall 2022 Total Dissolved Solids (TDS) Concentrations Maps

C:\Users\bmcevers\OneDrive - Stantec\Desktop\Intrmtn Power\2022_10\fig3A_Spring2022GWE_NewWells_DeltaUT_20221031_11x17.mxd

LEGEND:

MONITORING WELL TDS Concentration in milligrams per liter (mg/L)

4577.22 GROUNDWATER ELEVATION (FT AMSL) INFERRED

NOTES:

1) WATER LEVEL DATA COLLECTED SPRING 2022
2) ALL ELEVATIONS ARE FEET ABOVE MEAN SEA LEVEL (FT AMSL)
NS:NOT SAMPLED THIS EVENT.

0 1,300 2,600
Feet
1 in = 1,350 ft

Notes:

All units micrograms per liter (mg/L)

Statistical Analyses were only conducted on wells with a minimum of 8 sampling results. Additional wells will be incorporated as more data is collected

The mean and standard deviation are represented by the Kaplan-Meier mean and standard deviation for constituent/well pairs with non-detects, reported at the laboratory reporting limit

"--": Not applicable

Well ID BA-U-1 and BA-U-2 are upgradient of the Bottom Ash Basin and represent background conditions, all other wells are downgradient of the Bottom

January 18, 2023

Notes:
All units micrograms per liter (mg/L)
Statistical Analyses were only conducted on wells with a minimum of 8 sampling results. Additional wells will be incorporated as more data is collected
The mean and standard deviation are represented by the Kaplan-Meier mean and standard deviation for constituent/well pairs with non-detects, reported at the laboratory reporting limit
"--": Not applicable
Well ID WW-U-1, WW-U-2 and SI-U-1 are upgradient of the Waste Water Basin and represent background conditions, all other wells are downgradient of the Waste Water Basin

Notes:

All units micrograms per liter (mg/L)

The mean and standard deviation are represented by the Kaplan-Meier mean and standard deviation for constituent/well pairs with non-detects, reported at the laboratory reporting limit

Statistical Analyses were only conducted on wells with a minimum of 8 sampling results. Additional wells will be incorporated as more data is collected

"--": Not applicable

Well ID CL-U-1, CL-U-2 and CL-U-3 are upgradient of the Combustion By-Products Landfill and represent background conditions, all other wells are downgradient of the Combustions By-Products Landfill

All units micrograms per liter (mg/L), except for Radium 226+228 which has units of picocuries per liter (pCi/L)

UTL: 95% Upper Tolerance Limit with 95% coverage

MCL: US EPA Maximum Contaminant Level

AS: US EPA Alternative Standards establish for cobalt, lead, lithium, & molybdenum as these constituents do not have an MCLs

GWPS: Groundwater protection standard is the greater of the site specific UTL or the MCL/AS.

LCL: Lower confidence limit of the mean

LCB: Lower confidence band around trend line

Green Shading indicates that no detected concentration in the constituent/well pair exceed the GWPS

Yellow Shading indicates that the at least one detected concentration in the constituent/well pair exceeded GWPS, but the LCL/LCB is below the GWPS (e.g. No Statistical Evidence of a statistical significant level (SSL) above the GWPS)

Red Shading indicates that the LCL exceeds the GWPS or the LCB exceeds the GWPS at the last round of sampling. Evidence of a statistically significant level above the GWPS for the constituent/well pair.

CLW-1

Interval (feet)	Drilling Method	Sample Description
		5/11/2015
0-3	10" Sonic	Brown fine grained Sand with gravel, dry
3-6	10" Sonic	Light to Dark Brown fine to medium grained Sand, no gravel present, dry
6-8	10" Sonic	Light Brown fine grained Sand
8-11.5	10" Sonic	Grayish white fine grained Sand, gravels present, rounded, dry
11.5-13.5	10" Sonic	Tan SILT with clay matrix, slightly moist
13.5-17	10" Sonic	Grayish Tan CLAY with small amount of silt present, slightly moist
17-23	10" Sonic	Grayish Tan SILT with fine grain sand present, trace amounts of clay, slightly moist
23-27	10" Sonic	Tannish Gray CLAY, denser, dry
27-32	10" Sonic	Tan CLAY, slightly moist
32-35	10" Sonic	Tan CLAY, denser material, slightly moist
		5/12/2015
35-48	10" Sonic to 40 feet	Tannish gray CLAY, moist
48-51	8" Sonic	Tannish gray CLAY, moist, softer
51-52	8" Sonic	Orangish, Brown, black fine grained Sand, moist
52-54	8" Sonic	Orangish, Brown , Red CLAY, slightly moist
54-56	8" Sonic	Orangish Brown CLAY with a fine grained sand matrix, slightly moist
56-62	8" Sonic	Light Brown fine grained Sand, saturated
62-63	8" Sonic	Light Brown CLAY, slightly moist
63-63.5	8" Sonic	Fine to medium grained Sand, slightly moist
63.5-64	8" Sonic	Light Brown CLAY, dry to slightly moist
64-65	8" Sonic	Light Brown fine grained Sand with clay matrix, moist

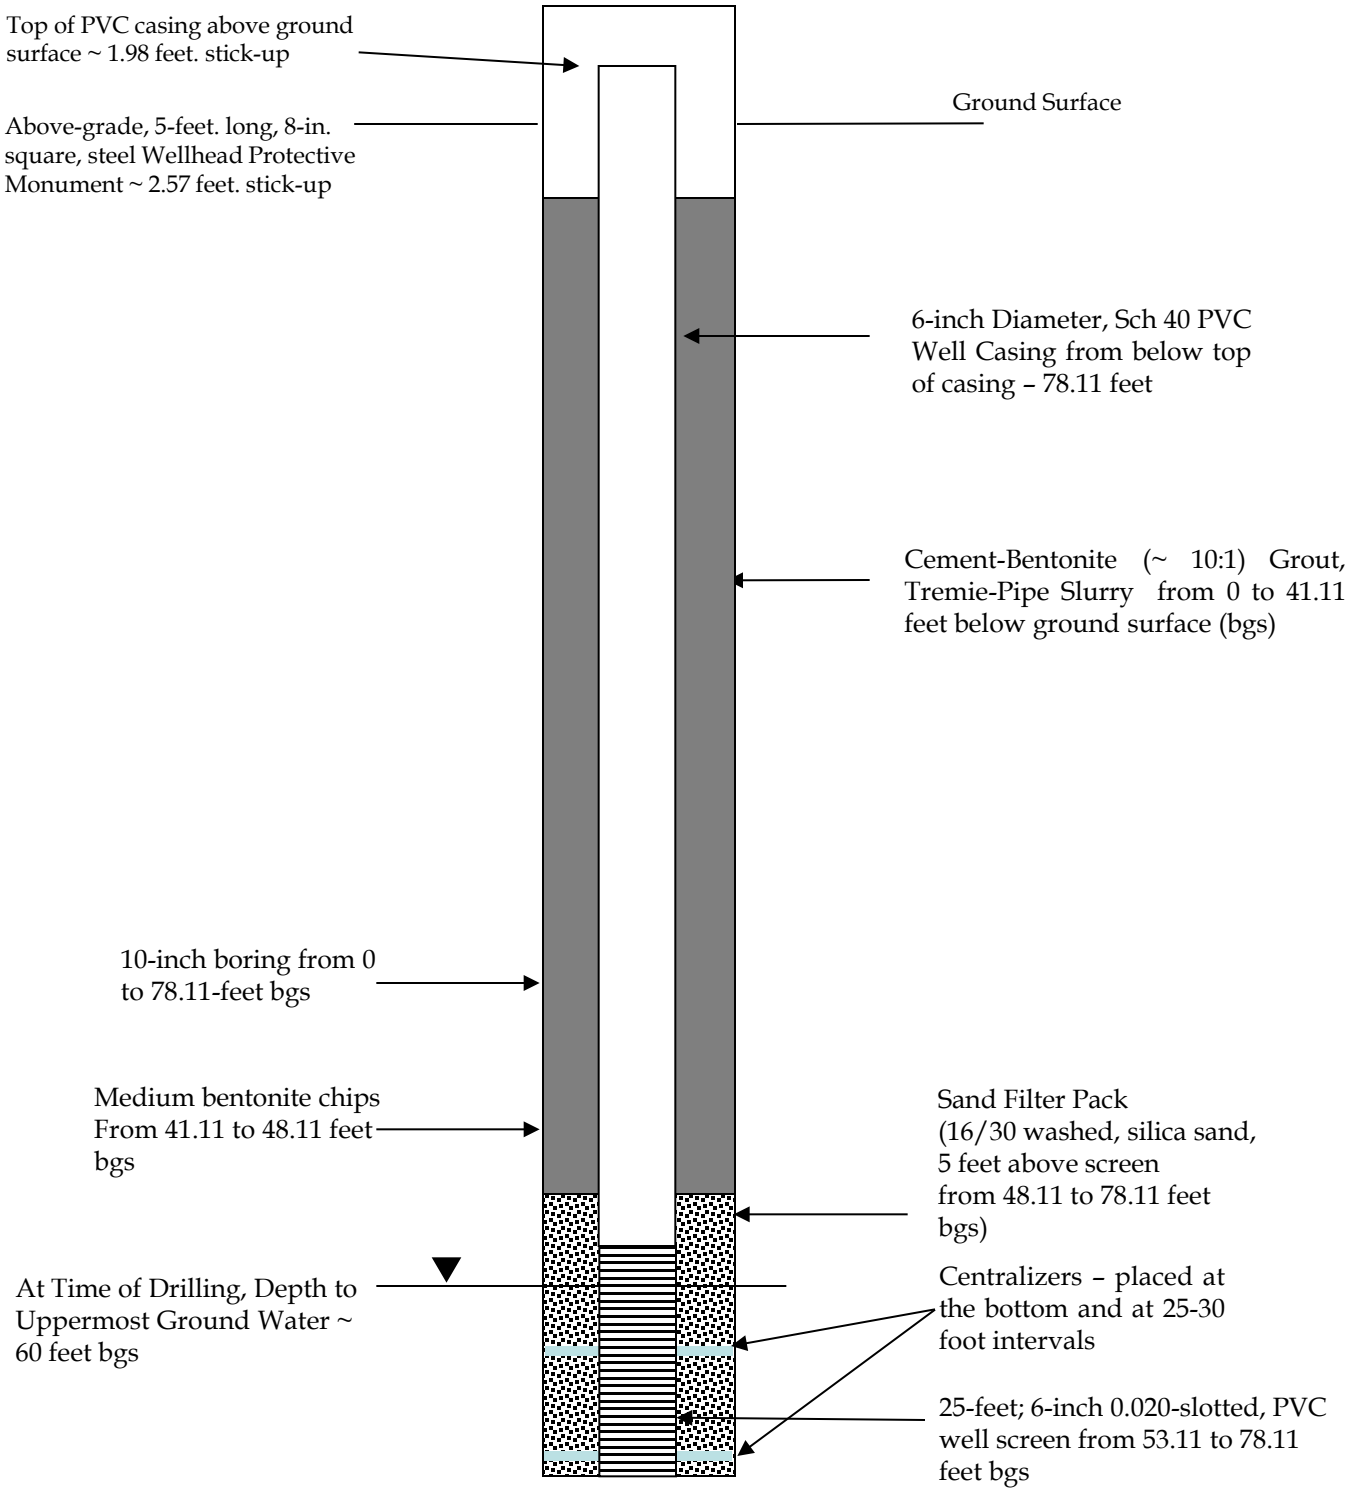
Sand Pack: 16/30 sand, 48.11-78.11 feet

Bentonite Seal: Hydrolyzed bentonite pellet seal 41.11-48.11 feet

Top of 6 in. PVC Casing Elevation (Relative Datum Survey): NA

Top of Manhole Cover (Relative Datum Survey): NA



Stantec	IPSC – BOTTOM ASH SURFACE IMPOUNDMENT DELTA, UTAH	
	BAC-9 Schematic	
		Date Drawn 6-4-19
Design by	Drawn by RP	Scale / Last Revision Date

Project Name: Intermountain Power Service Corporation
Boring Monitor Well: BAC-10

Project No.: 203709098
Completion Date: 2019-05-3

Drilling Firm: Cascade
Boring Method: Sonic
Boring Diameter: 10 inches

Driller: Ryan Miller
Logged by: Rich Pratt
Depth to Water at Drilling: 69 feet
Depth to Water at Drilling (static at 24 hours): 63.1 feet

BAC-10

Interval (feet)	Description
0 - 1	Light brown silt, dry
1 - 3	Light brown silt with clay, dry
3 - 14	Light brown clay with silt, dry
14 - 17	Light brown fine-grained sand, dry
17 - 19	Light brown fine-grained sand with clay, moist
19 - 21	Light brown fine-grained sand with clay, moist
21 - 23	Light brown fine-grained sand, moist
23 - 25	Light brown fine-grained sand with clay, moist
25 - 26	Light brown fine-grained sand, moist
26 - 27	Light brown fine-grained sand with clay, moist
27 - 28	Light brown fine-grained sand, moist to moist
27 - 34	Light brown fine-grained sand, moist
34 – 34.5	Light brown silt with clay, dry
34.5 – 40.5	Red brown clay, dry
40.5 - 41	Medium brown medium grained sand, moist to moist
41 - 45	Medium brown clay, moist
45 - 46	Medium brown sand, moist to moist
46 - 48	Medium brown clay, moist
48 – 56.5	Red brown clay, moist
56.5 - 57	Gray clay, moist
57 - 62	Light brown clay, moist to moist
62 - 63	Medium brown medium grained sand, moist
63 - 64	Medium brown medium grained sand with clay, moist
64 - 69	Red, brown, and gray clay, moist
69 – 69.5	Medium brown sand, saturated
69.5 - 77	Red, brown, and gray clay
77 - 79	Medium brown clay with sand
79 - 81	Medium brown clay
81 - 85	Medium brown clay with sand

85 - 87	Medium brown clay, moist

Well Completion materials and Depth Intervals (feet) Below Ground Surface

Surface Completion: Stick-up

Casing, solid (6-inch PVC): 0-62.95 feet

Screen (6 inch, 0.02 slotted, PVC): 62.95-87.95 feet

Sand Pack: 16/30 sand, 57.95-87.95 feet

Bentonite Seal: Hydrolyzed bentonite pellet seal 50.95-57.95 feet

Top of 6 in. PVC Casing Elevation (Relative Datum Survey): NA

Top of Manhole Cover (Relative Datum Survey): NA

DEPTH (feet)	LITHOLOGICAL DESCRIPTION
0	Fill Poorly Graded Sand with Silt (SP-SM), fine grained sand 100%, loose, soft, dry, very pale brown (10 YR 7/3).
5	
10	Clay with Sand (CL), low plasticity, soft to medium density, moist, light brownish gray (10 YR 6/2). Poorly Graded Sand with Clay (SP-SC), fine grained sand 85%, loose, medium dense, moist, light brownish gray (10 YR 6/2); clay are low plasticity, medium dense.
15	
20	Clay (CL), medium plasticity, medium dense, cohesive, moist, light brownish gray (10 YR 6/2), mottled with brownish yellow (10 YR 6/8).
25	
30	Poorly Graded Sand with Clay (SP-SC), fine grained sand 90%, loose, soft, moist, light yellowish brown (10 YR 6/4); clay low plasticity, soft, non cohesive. Same as above, becoming brown (10 YR 5/3).
35	
40	Clay (CL), medium plasticity, medium dense, cohesive, moist, light yellowish brown (10 YR 6/4).
45	
50	Poorly Graded Sand (SP), fine to medium grained sand 100%, loose, soft, wet, brown (10 YR 5/3).
55	Clay (CL), medium plasticity, medium dense, cohesive, moist, light yellowish brown (10 YR 6/4).
60	Clay with Sand (CL), low plasticity, soft, wet, pale brown (10 YR 6/3). Well Graded Sand (SW), fine to coarse Sand 95%, loose, soft, wet, brown (10 YR 5/3), trace gravel, subrounded.
65	Same as above, increase in coarse grained sand between 65.2 to 65.8 ft bgs. Same as 60 ft bgs.
70	
75	Clay (CL), medium plasticity, medium dense, moist, cohesive, light yellowish brown (10 YR 6/4).
80	End of borehole at 81 ft bgs. Installed monitoring well per scope of work.
85

DEPTH (feet)	LITHOLOGICAL DESCRIPTION
0	Poorly Graded Sand with Silt and Gravel (SP-SM), fine grained sand 85%, silts 10%, trace gravel 5%, loose, dry, light gray (10 YR 7/2).
5	Same as above, becoming dense, consolidated.
	Well Graded Sand with Gravel (SW), sand fine to coarse 85%, gravel 15%, loose, soft, dry, pale brown (10 YR 6/3), gravel are subrounded.
10	Same as above, no gravel, sand 100%.
	Clay with Sand (CL), low plasticity, dry to moist, non cohesive, brown (10 YR 5/3), with small clay interfingering, reddish yellow (5 YR 6/8).
15	Same as above, moist.
	Same as above, medium plasticity.
20	Poorly Graded Sand (SP), fine grained sand 100%, loose, dry, dark brown (10 YR 3/3), thinly bedded.
	Clay with Sand (CL), low plasticity, moist, non cohesive, brown (10 YR 5/3), with small clay interfingering, reddish yellow (5 YR 6/8).
25	
30	
35	Well Graded Sand with Gravel (SW), sand fine to coarse 85%, gravel 15%, loose, soft, dry, pale brown (10 YR 6/3), gravel are subrounded.
	Poorly Graded Sand (SP), medium grained sand 100%, loose, soft, moist, brown (10 YR 5/3).
40	Clay (CL), medium plasticity, medium dense, moist, brownish yellow (10 YR 6/6).
	Clay with Sand (CL), low plasticity, soft density, wet, non cohesive, light yellowish brown (10 YR 6/4).
45	Clay (CL), medium plasticity, medium dense, moist, cohesive, brownish yellow (10 YR 6/6), with mottled clay, brownish yellow (10 YR 6/8).
50	
55	Clay with Sand (CL), low to medium plasticity, soft to medium dense, wet, non cohesive, brown (10 YR 6/3).
	Clay (CL), medium plasticity, medium dense, moist to wet, cohesive, light brownish gray (10 YR 6/2).
60	Clay with Sand (CL), low to medium plasticity, soft to medium dense, wet, brown (10 YR 6/3).
	Clay (CL), high plasticity, stiff, moist, cohesive, pale brown (10 YR 6/3).
65	Clay (CL), medium plasticity, medium dense, moist to wet, cohesive, light brownish gray (10 YR 6/2).
	Clay (CL), high plasticity, stiff, moist, cohesive, pale brown (10 YR 6/3).
70	Poorly Graded Sand (SP), medium grained sand 95%, loose, soft, wet, brown (10 YR 5/3), trace gravel 5%, rounded to subrounded, assorted matrix.
75	
80	
85	Clay with Sand (CL), low plasticity, soft, wet, non cohesive, brown (10 YR 5/3).
	Clay (CL), medium plasticity, medium dense, moist to wet, cohesive, brown gray (10 YR 5/3).
90	End of borehole to 91 ft bgs., per scope of work.
95

		LOGGED BY: Joel Pierson	

DEPTH (feet)	LITHOLOGICAL DESCRIPTION
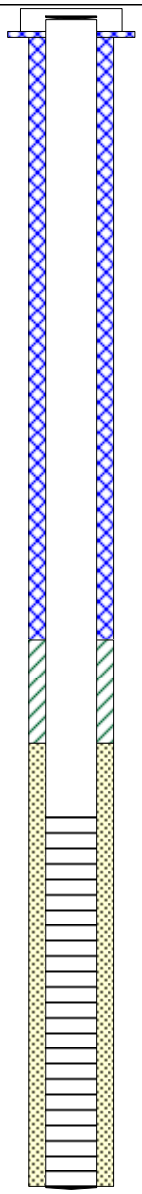
0	Silty Fine Sand (SM), sand 80%, fines 20%, dry, loose, light gray (2.5Y 7/2)
20	Silty Sandy Clay (CL), fines 90%, sand 10%, slightly moist, low plasticity, dense, hard, pale yellow (2.5Y 7/3)
	Silty Sandy Clay (CL), fines 70%, fine sand 30%, loose
25	Silty Sandy Clay (CL), fines 90%, sand 10%, slightly moist, low plasticity, dense, hard, iron staining, yellow (2.5Y 7/3)
35	Silty Fine Sand (SM), fine sand 70%, fines 30%, moist, loose
40	Fine Gravel (GM), sand 60%, gravel 30%, fines 10%, angular to subangular clasts
	Silty Fine Sand (SM), fine sand 70%, fines 30%, moist, loose
45	Sandy Clay (CL), fines 90%, sand 10%, moist, medium dense, low plasticity, light brownish gray (2.5 YR 6/2)
50	Fine Silty Sand (SM), sand 80%, fines 20%, moist, loose
	Silty Clay (CL), 100% fines, moist, hard, low plasticity, reddish
55	Silty Sand (SP), sand 90%, fines 10% , reddish gray (5YR 5/2)
	Silty Sand (SP), sand 70%, fines 30%, reddish gray (5YR 5/2)
60	Silty Clay (CL), fines 100%, dense, moist, medium-high plasticity
65	Fine Silty Sand (SM), sand 80%, fines 20%, moist, loose
75	Fine Silty Sand (SM), sand 60%, fines 40%, moist, loose
	Fine Silty Sand (SM), sand 80%, fines 20%, moist, loose
80	End of borehole at 78 ft bgs. Installed monitoring well per scope of work.



WELL CONSTUCTION DIAGRAM

- Above ground monument with well cap
- Borehole diameter 10 inches from 0 to 78 ft bgs.
- Grout 0 to 41 ft bgs.
- 0 to 53 ft bgs., 6 in dia., Sch. 80 PVC riser
- Bentonite 41 to 48 ft bgs.
- Filter Pack Sand 48 to 78 ft bgs.
- 53 to 78 ft bgs., 6 in dia., Sch. 80 PVC screen with 0.02 inch slot aperture
- End Cap

Notes: bgs. = below ground surface; dia. = diameter; ft = feet; Sch. = Schedule; YR = Yellow-Red

DEPTH (feet)	LITHOLOGICAL DESCRIPTION
0	Poorly graded Sand with Silt (SP), fine sand 95%, loose, soft, dry, very pale brown (10 YR 7/4), trace gravel 5%.
5	
10	Clay (CL), medium plasticity, cohesive, moist, soft to medium density, light gray (10 YR 7/1), mottled with some trace interfingered clay, brownish yellow (10 YR 6/8).
	Well Graded Sand with Clay (SW-SC), medium grained sand 85%, gravel 10%, clay 5%, moist, loose, pale brown (10 YR 6/3).
15	Clay with Sand (CL), low to medium plasticity, soft to medium density, non cohesive, dry to moist, brown (10 YR 5/3).
	Same as above, Clay (CL), no sand.
20	Poorly Graded Sand (SP), fine sand 98%, loose soft, dry, pale brown (10 YR 6/3), 2% gravel, subrounded.
25	
30	
35	Well Graded Sand with Gravel (SW), fine to coarse sand 90%, small gravel 10%, loose, moist, brown (10 YR 5/3), gravel are subangular to subrounded, assorted gravel matrix.
40	
45	Clay (CL), medium plasticity, medium density, moist to wet, cohesive, pale brown (10 YR 6/3).
	Well Graded Sand with gravel (SW), fine to coarse sand 90%, gravel 10%, loose, soft, brown (10 YR 5/3).
50	
	Same as above, becoming wet.
55	Clay (CL), medium plasticity, medium density, wet, cohesive, pale brown (10 YR 6/3).
	Clay with Sand (CL), low to medium plasticity, soft to medium density, non cohesive, moist, pale brown (10 YR 6/3).
60	Same as above, fine grained sand, saturated, low plasticity, non cohesive.
65	Same as above, with trace interfingering clay, reddish yellow (5 YR 6/6).
70	
	Well Graded Sand with Gravel (SW), fine to coarse sand 90%, small gravel 10%, loose, wet, brown (10 YR 5/3), gravel are subrounded, assorted matrix.
75	
80	
85	
90	Clay with Sand (CL), medium plasticity, medium density, wet, cohesive, pale brown (10 YR 6/3).
95	End of borehole to 91 ft bgs., per scope of work.

		LOGGED BY: Michael Ward	

DEPTH (feet)	LITHOLOGICAL DESCRIPTION
0	Poorly Graded Sand with Silt (SP-SM), 90% sand, 10% silts, light gray (7.5 YR 7/1), soft, loose, fine grained, dry, sand are mostly quartz, subangular quartz grains.
5	Same as above, becoming light yellowish brown (10 YR 6/4).
10	Same as above, becoming wet at 8.5 ft bgs., perched groundwater.
	Clay (CL), medium plasticity, medium stiff, cohesive, very pale brown (10 YR 7/4).
15	Poorly Graded Sand with Silt (SP-SM), 95% fine grained sand, 5% silts, loose, soft, moist, brown (10 YR 4/3), trace gravel.
	Well Graded Sand with Gravel (SW), 80% sand, 20% gravel, fine to coarse sand, moist, loose soft, dark yellowish brown (10YR 4/4), gravel are subrounded to rounded, small.
20	
25	Clay (CL), medium plasticity, medium density, moist, cohesive, light yellowish brown (10 YR 6/4), thickly bedded, sharp contact at 25 ft bgs.
30	
	Poorly Graded Sand (SP), fine grained sand 100%, loose, soft, moist, brown (10YR 5/3).
35	
40	Well Graded Sand with Gravel (SW), fine to coarse grained sand 90%, small gravel 10%, loose, soft, moist, dark yellowish brown (10 YR 4/4).
45	Same as above, increase in gravel to 30%.
	Same as above, decrease in gravel to 10%.
50	Poorly Graded Sand (SP), fined grained sand 100%, loose, moist, brown (10YR 4/3). Sharp contact.
55	Clay (CL), high plasticity, stiff, moist, cohesive, light yellowish brown (10 YR 6/4), sharp contact.
60	Lost core sample from sonic casing.
	Clay (CH), high plasticity, stiff, moist, cohesive, yellowish brown (10 YR 5/4).
65	
70	Well Graded Sand with Silt and Clay (SW-SM), fine or medium grained sand 100%, soft, loose, brown (10 YR 4/3).
75	Clay (CH), high plasticity, stiff, moist, cohesive, yellowish brown (10 YR 5/4).
80	Poorly Graded Sand with Silts and Clay (SP-SC), fine grained sand 95%s, soft, loose, wet, light yellowish brown (10 YR 6/4), trace clay.
85	Clay with Sand (CL), medium plasticity, soft to medium density, wet, pale brown (10YR 6/3), sand are fine grained.
	Same as above with gradational transition to clay.
90	Clay (CH), high plasticity, mottled, wet, cohesive, pale brown (10 YR 6/3), mottled color is reddish yellow (7.5 YR 7/6).
95	End of borehole to 91 ft bgs., per scope of work.

Interval (feet)	Drilling Method	Sample Description
0 - 11	SDM	Light Brown fine grained SAND with pebbles present from 3 - 7 feet, Dry
11 - 16	SDM	Light Brown fine grained SAND with interbeds of brown CLAY, Dry
16 - 35	SDM	Light Gray CLAY, moist at ~ 35 feet,
35 - 37	SDM	Light Gray Clay with a fine to medium grained sandy matrix, very moist
37 - 48	SDM	Brown fine to medium grained SAND, saturated
48 - 50	SDM	Brown CLAY, dry
50 - 53	SDM	Brown to Black medium grained SAND, saturated
53 - 57	SDM	Brown CLAY with two fine grained sand layer present
		Total Depth = 57 feet BGS, Screened from 37 – 57', Sand 34-57', Bentonite 31-34, Grout 0-31'

Well Completion Materials and Depth Intervals (ft.)

Surface Completion: Stick-up
Casing, solid: 6 inch diameter sch. 80 PVC casing, 0-9 ft.
Casing, solid: 6 inch diameter sch. 40 PVC casing, 9 -37 ft.
Screen: 6 inch diameter sch. 40 PVC well screen 0.025-slotted, 37-57 ft.
Sand Pack: 16/30 washed, silica sand, 34-57 ft.
Bentonite Seal: "Pure Gold" Bentonite Pellets, 31-34 ft.
Cement-Bentonite (10:1 ratio) Grout: 0-31 ft.

DRILLING LOG

PROJECT NAME: Intermountain Power
Plant BORING/MONITORING WELL: WR-103

PROJECT No.: 08.00463.01
COMPLETION DATE: 3/31/2009

DRILLING FIRM: Boart Longyear
BORING METHOD: Sonic
BORING DIAMETER: 10.0-inch

DRILLER: Chato
LOGGED BY: Thomas Hedrick
DEPTH TO WATER (at drilling): ~ 40 ft.
DEPTH TO WATER (static > 24-hrs.): ~ 30 ft.

WR-103

Interval (feet)	Drilling Method	Sample Description
0 - 3	SDM	Brown to Light brown fine grained SAND to silt, Dry
3 - 15	SDM	Light brown fine to medium grained SAND, pebbles present from 3 - 5 feet, Dry
15 - 17	SDM	Light brown fine to medium grained SAND, with interbeds of light brown CLAY with a sandy matrix, Dry
17 - 24	SDM	Light brown CLAY, Dry
24 - 37	SDM	Reddish Gray CLAY, Dry
37 - 45	SDM	Brown to Black medium fine to medium grained SAND, very moist
45 - 47	SDM	Brown fine grained SAND with a CLAY matrix, very moist
47 - 52	SDM	Brown Fine to medium grained SAND, saturated
52 - 55	SDM	Red CLAY, dry
		Total Depth = 55 feet BGS, Screened from 35 – 55', Sand 32-55', Bentonite 29-32, Grout 0-29'

Well Completion Materials and Depth Intervals (ft.)

Surface Completion: Stick-up
Casing, solid: 6 inch diameter sch. 80 PVC casing, 0-6.5 ft.
Casing, solid: 6 inch diameter sch. 40 PVC casing, 6.5 -35 ft.
Screen: 6 inch diameter sch. 40 PVC well screen 0.025-slotted, 35-55 ft.
Sand Pack: 16/30 washed, silica sand, 32-55 ft.
Bentonite Seal: "Pure Gold" Bentonite Pellets, 29-32 ft.
Cement-Bentonite (10:1 ratio) Grout: 0-29 ft.

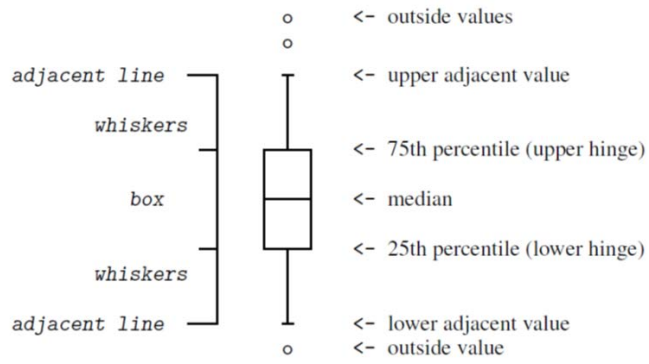
The diagram below graphically depicts the basics of the construction of the box plots (StataCorp LLC 2017).



The box portion of the plot is the interquartile range (IQR), which represents the middle 50 percent of data, with the bottom of the box being the 25th percentile and the top of the box being the 75th percentile. The line inside the box is the median concentration. The top of the upper “whisker” represents the first observed concentration above the 75th percentile, whereas the bottom of the lower “whisker” represents the first observed concentration below the 25th percentile (upper adjacent value and lower adjacent value, respectively). Values that lie outside of the adjacent values represent outside (or outlier) concentrations (i.e. concentrations at the upper and lower ends of the distribution of the data). The method detection limit (MDL) was used as the reported value in order to construct the box plot when analytical results were reported as non-detects.
